

# KK-FRP AND KONCRETE PRODUCTS

Mr. Archit Aggarwal - Director  
KK-FRP And Konkrete Products Pvt. Ltd.

**W**e are aware that Climate change poses an existential threat to all living species on earth, and we, at KK FRP and Konkrete Private Limited, understand the urgency of being part of the collective effort towards combating the climate crisis. We are aware of the problem that concrete production poses as one of the largest contributors of greenhouse gas emissions, and the

need for us in the infrastructure industry to collectively choose to transition away from traditional manufacturing practices to build a sustainable planet for our future generations. With a new vision in our company charter, we want to push the boundary of what it means to exhibit planet responsible business practice by innovating greener product alternatives as well as

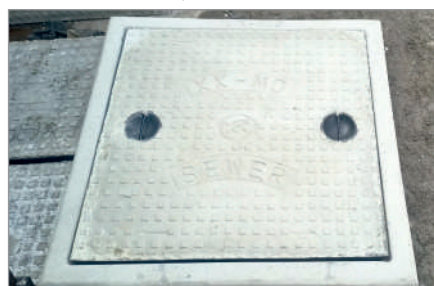

transiting manufacturing operations towards environment friendly methods. We are approaching the sustainable revolution with comprehensive goals that include reduction of manufacturing waste, reduction of carbon footprint, development of greener products and contribution towards a circular economic system. Some of the sustainable initiatives that we have already incorporated include using industrial fly-ash by-product waste for precast concrete production, re-using our own manufacturing waste back into the production system as raw material for our products and powering our manufacturing facilities with green electricity through the installation of rooftop solar panels. For our ongoing initiatives, we are pleased to announce that we are researching greener raw material alternatives like green cement and recycled plastic waste. We have already prototyped manhole covers with green cement and recycled plastic waste that we envision to launch sometime in 2022. Going forward, we will continue focusing on strengthening the circular economy system of our product line as well as achieving (a phased-wise) carbon offsetting goals through auditing of our end-to-end operations and carbon offsetting projects to steer our environmental commitment further.

Our initiatives represent the beginning of our commitment towards defining new environmental ethical standards for the infrastructure industry to adopt environmentally conscious societal development. We hope that the journey of KK Goes Green inspires all sub-sectors of infrastructure solution providers to explore environmental ethical behavior.
